Subject: Caloosahatchee & Estuary Conditions Report

Reporting Period: **July 12 – 18 2022**

This report provides a scientific assessment of Caloosahatchee River and Estuary conditions and how these conditions affect the health, productivity, and function of the system.

Caloosahatchee Conditions Summary: Flow to the Caloosahatchee Estuary had a 7-day average of **1,209 cfs** at **S-79** with a 7-day average of **0 cfs (0%)** coming from the lake at **S-77**. **The 14-day moving average flow at S-79 is 1,240 cfs and has been in the optimal flow envelope (750 - 2100 cfs; RECOVER 2020) for 23 days.**

Recommendation: We encourage the Corps to maintain flows within the RECOVER 2020 optimal flow envelope of 750 – 2,100 cfs at S-79 for the Caloosahatchee Estuary. Flows from the Lake should be suspended when local basin runoff exceeds 2,100 cfs at S-79 or when cyanobacteria blooms are present near S-77.

USACE Action: On 7/9/22 the USACE reduced target flows at the W.P. Franklin Lock and Dam (S-79) to 7-day average pulse release of 750 cfs from the previous target of 1000 cfs. If target flows exceed 750 cfs from local basin runoff, releases from the Lake at the Julian Keen Jr Lock and Dam (S-77) will not occur.

Lake Flows: In the past 7 days the total outflow from Lake Okeechobee was **300 AF** with **0 AF** to the Caloosahatchee through **S-77**, **0 AF** through **S-310** in Clewiston, and **0 AF** to the EAA through **S-351**, **S-352**, and **S-354**. The total net inflow to the Lake was **11,418 AF** (5,314 AF from Fisheating Creek, S-71, S-72, S-84s, S-65EX, and S-65EX1) with a total backflow volume of **6,104 AF** from **S310**, **C10A**, and **S308**. Water conservation areas received flows of **2,878 AF**, **5,950 AF**, and **11,113 AF** at **WCA1**, **WCA2**, and **WCA3**, respectively. Everglades National Park received **24,750 AF**.

Lake Level: 13.08 ft (Base Flow sub-band)

Last Week: 12.97 ft

Last Year: 13.47 ft

Lake Okeechobee Inflow: 684 cfs

Lake Okeechobee Outflow: 166 cfs

Weekly Rainfall Total:

WP Franklin \geq 2.42"

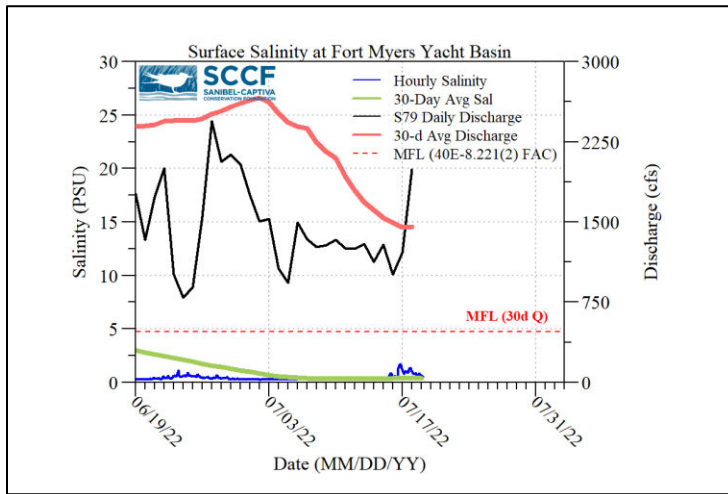

Ortona \geq 2.54"

Moore Haven \geq 1.69"

7-Day Lake Recession Rate: +0.08 ft/week

25% Iz is the depth (z) where irradiance (I) is 25% of surface irradiance. Target values indicate the depth of light penetration needed for healthy seagrass.
^m measured, ^c calculated

Cyanobacteria Status: On 7/18/22 sampling for cyanobacteria by the Lee County Environmental Lab reported the presence of *Planktothrix*, *Dolichospermum*, and *Microcystis* at the **Alva Boat Ramp** and *Microcystis* at the **Davis Boat Ramp**.

Upper Estuary Conditions: The 30-day average surface salinity at the Fort Myers Yacht Basin was 0.4 psu, within the suitable range for tape grass.

Lower Estuary Conditions: The average salinity at Shell Point RECON was 24 psu, within the optimal range for oysters, but below optimal for seagrass.

Red Tide: On 7/15/22, the FWC reported that the red tide organism, *Karenia brevis* was not observed in Southwest Florida.

Daily average bottom salinity data for the last 14-days from sampling locations within the tidal Caloosahatchee River Estuary relative to oyster health (Sanibel, Shell Point and Cape Coral) and tape grass (*Valisneria americana*) health (Ft. Myers only) conditions.

Data are provisional and subject to change.
